

Solid that contains water molecules

The process of photosynthesis, which is carried out by plants, algae, and some bacteria, involves the conversion of sunlight, water, and carbon dioxide into oxygen and energy in the form of ...

This allows water to be a polar molecule, which allows it to interact with many other molecules necessary for life. Most of the substances in a cell are floating around in a water-based cytoplasmic environment. Chemical Structure ...

It consists mainly of water molecules and lacks the solid particulates found in smoke. Unlike smoke, steam is usually translucent and often rises rapidly, dispersing into the air without any ...

On Earth, water generally freezes into a crystalline structure, but in space, water accumulates on dust particles molecule-by-molecule. It was thought that it was too cold for the molecules ...

Water glass, a compound containing sodium oxide (Na_2O) and silica (silicon dioxide, SiO_2) that forms a glassy solid with the very useful property of being soluble in water. Water glass is sold as solid lumps or powders or as a ...
